

OpenAI DevDay 2026 updates for your work

Five ChatGPT updates that could reshape how you organize projects, collaborate, and perform recurring work.

ChatGPT is expanding beyond individual conversations. New features can support ongoing responsibilities, maintain shared project context, and work inside tools your team already uses.

Here are the updates most likely to affect everyday business work.

01

Dots can keep ongoing work moving

A dot is an always-on agent that can remember context, use approved connected apps, complete scheduled work, and bring results back for review.

WHAT THIS MEANS FOR YOU

You could give a dot responsibility for work you currently restart every day or week, such as checking upcoming deadlines, monitoring a project, gathering updates, or preparing a morning brief. You define what it may do independently and which decisions must come back to you.

Available on Pro and Business Premium, with an admin-enabled beta for Enterprise, Edu, and Healthcare. Create a dot in the ChatGPT desktop app or on desktop web, then work with it in ChatGPT, Slack, or Microsoft Teams. Rollout is gradual.

02

Space and Pages organize ongoing projects and research

Space brings related Pages, files, conversations, and shared context into one project area. Pages are editable documents where people and ChatGPT can develop and maintain work together.

WHAT THIS MEANS FOR YOU

Ongoing projects and research can stay organized in one place instead of being scattered across chats and files. A Page can be scheduled to update from approved sources, which could help maintain project trackers, weekly status reports, research briefs, account plans, or policy summaries. Teammates can collaborate in the same Space using shared context.

Available on Pro, Business, and Enterprise, where Space replaces Library. Create and edit Pages on the web and in the desktop app; on mobile you can find, read, and share them. Enterprise sharing is an opt-in preview.

03

Team Tasks can run recurring work for the group

Business and Enterprise teams can create shared tasks that run on a schedule or when a supported event occurs. Tasks can use administrator-approved connections to gather information or take permitted actions.

WHAT THIS MEANS FOR YOU

Recurring work no longer needs to depend on one person remembering to start it. A team could automatically prepare a Monday customer update, summarize new project activity, create an onboarding brief when a deal closes, or draft a report when new information arrives.

Available in Business and Enterprise workspaces. Tasks run in the cloud using connections configured for the team, so the creator doesn't need to keep ChatGPT open. Enterprise admins control who can create or update tasks.

04

Meeting notes can flow into follow-up work

The Meetings plugin can record virtual and in-person meetings, produce personalized notes and action items, save them in ChatGPT Space, and help turn the discussion into follow-up work.

WHAT THIS MEANS FOR YOU

Instead of manually moving notes into emails, project plans, and task lists, you can ask ChatGPT to draft the follow-up or update a shared Page. That can reduce administrative work between a meeting and the next action.

In beta for Pro and Business in the ChatGPT desktop app for macOS, with Enterprise access coming later. Follow your organization's meeting-consent policy.

05

@ChatGPT can work inside Slack and Microsoft Teams

Business and Enterprise organizations can enable @ChatGPT in Slack and Microsoft Teams. People can mention it in a channel, thread, or direct message to work with the conversation and approved connected tools.

WHAT THIS MEANS FOR YOU

You can ask ChatGPT to summarize a long discussion, surface decisions and unanswered questions, draft a response, or turn a conversation into an action list without moving everything into a separate chat. Colleagues can review and refine the result together in the same conversation.

Available on Business, Enterprise, and Edu. A ChatGPT workspace admin configures it and a Slack or Teams admin approves the app. Teammates without a ChatGPT license can use it in enabled channels.
